Here’s an interesting tidbit that was news to me. Did you know that arsenic-based compounds were deliberately added to most chicken feed?

The purpose is to kill parasites that cause diarrhea in the chickens and improve the color of chicken meat.

Some of the added arsenic ends up in the chicken meat and adds to your dietary intake of arsenic.

If you couple this fact with the reality that there are:

- PCB’s in salmon from aquaculture
- Perchlorate in produce from California

I’m moved to ask:

Where’s the beef?

Tyson foods, the largest U.S. poultry producer stopped in 2004 and McDonalds asked its suppliers to stop in 2007.

In 2001 the US EPA lowered the MCL for As in drinking water from 50 µg/L to 10 µg/L.

Ooops; I forgot to mention mad cow disease, & prions.
